

Service Group Distribution Announces Addition of Solar Control Paint to Product Lines

FULLERTON, Calif., July 16, 2013 – Service Group Distribution (SGD) announced the addition of Liquisol Solar Control Paint to its solar control product line. Designed specifically for polycarbonate, acrylic and plastic skylight applications, Liquisol provides long-lasting solar control to materials and surfaces where window film cannot be used.

SGD distributes four Liquisol paints: 4Ever, 4EverBlue, 4EverDark and 3Seasons. Each can be applied to glass, acrylic or plexiglass conservatories, skylights and sky domes to reduce heat and glare. “Skylights enhance rooms by bringing in sunlight,” said Brian Rodriguez, SGD Sales Executive. “With this light sometimes comes unwanted heat and glare. Liquisol paints are an affordable and effective way to reduce those problems.”

Liquisol paints let in sunlight but reflect infrared heat while blocking >98% of harmful UV rays. This makes the indoor environment more comfortable, while lowering cooling costs and extending the life of furniture, fabrics and artwork by resisting discoloration.

Liquisol’s 3Seasons was designed for hot summer, extremely cold winter climates. This temporary paint can be easily removed and reapplied when needed, allowing excessive solar heat to be blocked most of the year while taking advantage of solar gain during winter.

Liquisol’s 4Ever, 4EverBlue and 4EverDark are permanent solar reflective paints. Each was designed to provide a choice of visible light transmissions and heat rejection. The newest of these, 4EverDark, provides extreme heat and glare protection while 4Ever let’s in the most light and is optimal for applications where customers want heat and glare control combined with a maximum amount of light.

4EverBlue puts off a blue hue designed to mimic the sky, giving occupants the feeling of beautiful weather outdoors while providing an efficient solar control solution. 4EverBlue has a 57% Total Solar Energy Rejection.

“Skylights are a major source of heat, glare and excessive light during summer. While window film is a great solution, there are skylights where it simply can’t be used. Liquisol fills this void; not only can it be applied to acrylic and polycarbonate, because it’s a paint, you can apply it to curved surfaces too,” commented Earl Mangune, SGD’s Manager Pro Tem and Director. “Best of all, Liquisol lasts longer, is faster to apply and costs about the same. “
